Job Title	Back End Engineer
Department	Software Development
Location	Jaipur/Delhi
About Gram Power	Gram Power is an energy technology company founded out of Berkeley, California. We have developed disruptive smart grid technology to radically changing the way electricity is supplied to and consumed by users. Our work has resulted in us designing the lowest cost smart meter in the world, the most advanced power distribution management technology and a smart microgrid solution for energy access in remote areas. Our technology enables rural and urban consumers to access reliable and clean energy, and to control and optimize their electricity expenses using their phones. Consumers pay for power just like they purchase recharge coupons for cell phones and interact with their power distribution companies like never before. Our technology also helps eliminate theft, pilferage or non-payment of power bills. The company's technology was also selected by NASA among the top 10 cleantech innovations around the world. We have so far brought smart grids to 30 remote areas in rural India through our Smart Grid solution. We are now bringing our technology to the national grid by managing power distribution for India's biggest private power distribution company. Gram Power will be soon launching in Africa to bring energy to 1 million families. With strong funders from Europe and Silicon Valley, we are now bringing the benefits of our intelligent energy technology to rural and urban areas worldwide.
About The Position	Gram Power's cloud computing today is built on AWS. The system connects to a large number of distributed Data Concentrator Units spread across India's power distribution network and our Smart Grids in rural areas. This helps establish two way communication and control of all our Smart Meters. In this position you will be working on designing and building Gram Power's core cloud application architecture. We are looking for a back end engineer with experience in cloud computing, data security and architecting large scale systems.
Job Responsibilities	1. Setup and maintain a high performance and reliable cloud service that can scale up to managing data collection from millions of smart meters on the field. 2. Implement a backend datastore that can handle thousands of writes per second. 3. Architect the data storage to ensure fast access of data for analytics and visualization. 4. Optimize processes run on cloud servers to minimize costs. 5. Ensure high system uptime. 6. Design security features to protect user privacy and ensure data security.
